

HIGH PRESSURE NEWS

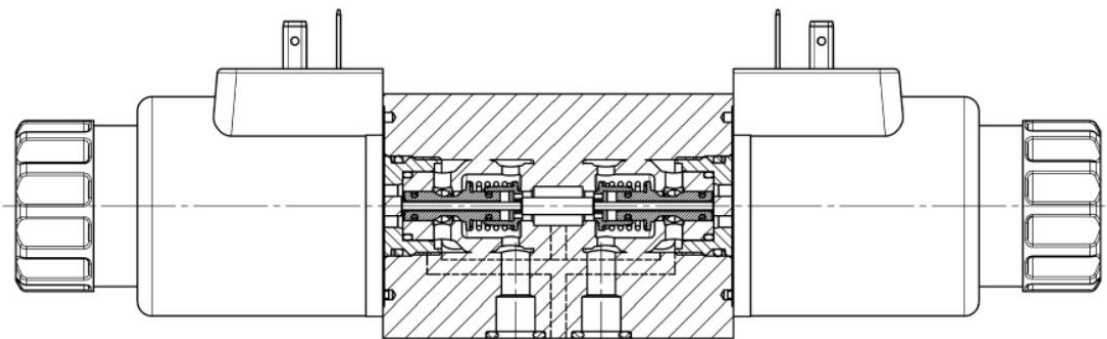

**Reduce electricity costs thanks
to BIERI Restriction**

Directional poppet valve with detent function 500 bar

WVM-6i-Y-OF

BIERI presents its new high-pressure poppet valve with detent. The particularly compact patented system enables the respective switching position to be held safely without the coil having to be energized. Only a short current pulse is required to change the switching position. The valve immediately detents into the other switching position. You can hold the valve in the desired position for as long as you like. This not only provides secure holding of the switching position during a power failure but also significantly reduces energy costs!
